Researchers at the University of Minnesota are seeking children for a research study. The purpose of the study is to try out a new iPad game called “Hopscotch Kids.” This game may tell us about how the two halves of children’s brains are connected.

We are seeking healthy children between 3-17, as well as kids with a genetic condition called adrenoleukodystrophy (ALD). Participants would attend a 30-45 minute virtual session accompanied by a parent. During the session, participants would complete a series of iPad and computer activities. Each visit is scheduled at your family’s convenience.

Both child and parent would receive a $10 gift card to Target for their participation.
